Abstract (en)  
The structural system dedicated to making a formwork of footings and foundation walls is characterized by the fact that it consists essentially of three elements, the assembly frame (2), modular, insulated formwork board (1) and the "U" type stirrup (3) connected with each other in defined way and repeated many times depending on the construction design to obtain the full length of a formwork. The assembly frames (2) with the width of the designed footing formwork are placed at a distance of not less than 400mm, one from the other, on the bottom of the formwork ditches, then modular insulated boards (1) are mounted to the sides (4) of the assembly frame with binding wire. In order to create a monolithic wall, prepared reinforcement of a formwork bench is sprinkled with sand and then gradually filled with concrete mass. Then, reinforcement of a foundation wall is mounted to a formwork bench by connecting subsequent elements of the assembly frame (2) with the width designed for a foundation wall with the use of a U-type stirrup (3) and attaching modular, insulated formwork boards (1) to them, creating a ready monolithic wall with the width and height in accordance with the design and ready to be filled with concrete mass.
