Abstract (en)

An apparatus comprising means for:receiving at least N audio channels where each of the N audio channels can be rendered as a different audio source;controlling mixing of the N audio channels to produce at least an output audio channel, wherein the mixing selects for mixing to produce the output audio channel, a sub-set of M audio channels from the N audio channels, wherein the selection is in dependence upon prioritization of the N audio channels, and wherein the prioritization is adaptive depending at least upon a changing content of one or more of the N audio channels; andproviding for rendering at least the output audio channel.
