Abstract (en)
[origin: WO2022175223A2] A shoulder rest (30) for a stringed instrument, which shoulder rest has a support element (32) which extends in a longitudinal direction (L) for support on the player's shoulder and/or chest and on which a number of foldable clamping units (34) are provided, should be adaptable in a particularly simple manner to different geometric specifications. For this purpose the shaft (50) of the or each clamping unit (34) is mounted by means of integrally formed pivot pins (58) in an associated rotary mounting (55), each of the mounting shells (60) thereof being designed according to the invention in the manner of a curved segment which does not surround or enclose the pivot pin (58) completely, but only over a certain length of the curve. The shaft is preferably placed eccentrically and thus enables particularly simple and fast dimensional adjustments.
