Abstract (en)
[origin: EP4044283A1] The present application provides a silicon-oxygen composite negative electrode material and a preparation method therefor, and a lithium ion battery. The silicon-oxygen composite negative electrode material has a core-shell structure, the core comprises nano-silicon and a silicon oxide SiO_x , and the shell comprises Li_2SiO_3 . The preparation method comprises: mixing a silicon source and a lithium source, and performing heat treatment in a non-oxygen atmosphere to obtain a composite material containing Li_2SiO_3 ; and immersing the composite material containing Li_2SiO_3 in an acid solution to obtain the silicon-oxygen composite negative electrode material. The nano-silicon in the negative electrode material provided by the present application is wrapped by SiO_x , and the surface of SiO_x is further wrapped with the Li_2SiO_3 having a stable structure, making it difficult for the nano-silicon to come into physical contact with substances other than the SiO_x and impossible to come into direct contact with water, thereby effectively inhibiting gas production of a battery.
