Abstract (en)
The invention relates to a container-carrying device comprising a body that has on the surface thereof at least one opening that is sized for a container to be passed and tightly inserted therethrough, said opening having a contour that has at least one tab extended towards the inside of the same opening, thereby defining a transition region between the tab and the body, said tab having folding or bending capability in relation to said body, said contour having, on at least one section adjacent to the transition region between at least one tab and the body, a rounded chamfer geometry.
