Abstract (en)
[origin: CN114592602A] A building has a first building component, a second building component, and a barrier seam extending between the first building component and the second building component. A thermally insulating structural element is arranged in the barrier seam. The invention relates to a heat-insulating structural element having an insulating body with longitudinal sides which lie opposite one another, a first longitudinal side being arranged on a first building component and a second longitudinal side being arranged on a second building component. The first longitudinal side extends at least partially perpendicularly above the second longitudinal side. The thermally insulating structural element has a force transfer element which projects through the insulator from the first longitudinal side to the second longitudinal side. At least one first force transmission element made of a pourable non-metallic material is provided. The first force transmission element is a pressure-thrust bearing which is designed to transmit a vertically directed pressure force and to transmit a transverse force which is horizontally directed and which is perpendicular to the longitudinal direction of the barrier seam.
