Abstract (en)

[origin: EP4050209A1] A wind turbine system (1) includes: a ring gear (110); a yaw drive unit (120) including a pinion gear (230) meshing with the ring gear (110), the yaw drive unit (120) being configured to rotate the pinion gear (230); a yaw brake unit (130, 140) configured to generate a braking force for inhibiting rotation of the ring gear (110); a load information acquiring unit (310) configured to acquire an external load applied to the ring gear (110); and a control unit (320) configured to release the braking force of the yaw brake unit (130, 140) when a rotational torque generated on the ring gear (110) by the yaw drive unit (120) has been larger than the external load acquired by the load information acquiring unit (310), in switching the ring gear (110) from a stationary state to a rotating state.
