Abstract (en)
[origin: WO2022157242A1] The present invention relates to a slackline apparatus (10) comprising a main part (12) having at least one support section (16) and two end sections (18, 20) which are opposite each other and which are arranged elevated relative to the at least one support section (16), and having a strap (14) which, in the assembled state of the slackline apparatus (10), is tensioned between the two end sections (18, 20) of the main part (12). The slackline apparatus (10) is preferably portable. Strictly speaking, the slackline apparatus (10) according to the invention is not a slackline in the actual sense but rather an apparatus which imitates the behavior of a slackline through a somewhat different type of embodiment, which is, however, still very realistic to the user.
