Abstract (en)
[origin: WO2021084412A1] A scaffolding comprises a system of scaffold elements, comprising uprights (10) and ledgers (20) which extend therebetween and are coupled to the uprights. The scaffolding further comprises at least one intermediate element (30) which mutually connects a first scaffold element (21) and a second scaffold element (22) diagonally. The intermediate element (30) comprises for this purpose an elongate body from which extends at a distal outer end a set of at least substantially parallel hook members (31, 32), each having an at least substantially cup-like jaw (40) which engages round the first scaffold element (21) connected thereto. The hook members (31, 32) have an opposite orientation so that the jaws (40) engage round the first scaffold element (21) from opposite sides. The hook members maintain a mutual distance (w) which is greater than a distance between the opposite sides of the first scaffold element (21).
