Abstract (en)
[origin: WO2021084173A1] The present invention relates to a method for estimating the thermal state of an internal component of a heat engine of a powertrain, allowing thermal management to be improved in the event of engine shut-off. More specifically, the invention proposes, on the one hand, a method involving estimating the internal temperature (T_m) of the engine based on the heat flow generated by the combustion of the working engine and on the action of the cooling fluid and, on the other hand, a method for controlling authorisations for engine shut-offs (CS_auth) and a method for controlling the activation duration of a cooling pump as a function of said temperature (T_m) in order to avoid thermal shocks. The invention is applicable to conventional and hybrid powertrains.
