Abstract (en)

[origin: WO2021122298A1] Proposed is a transmission device for transmitting data between a real first network and a real second network. The transmission device has a first network port for coupling to the real first network and a second network port for coupling to the real second network and also comprises: a simulation unit which is connected to the first network port and which is configured to receive network-specific data from the real first network via the first network port, to provide, in accordance with the received network-specific data, a virtual simulation network of the real first network, and to prepare the provided virtual simulation network, via the second network port, for access to said provided virtual simulation network by the real second network. The transmission device provided allows an attacker to be deliberately deceived, which advantageously increases security against attempts to access the real first network from the real second network.
