Abstract (en)
[origin: CA3152308A1] The invention relates to a support means (4) for a ceiling support (3) for supporting a ceiling formwork panel (2). The support means (4) has at least one upper elongated support element (7) and a lower elongated support element (8). The support elements (7,8) are rotationally connected to one another, with the support elements (7,8) being able to be brought into a working position in which the support elements (7,8) are preferably aligned coaxially with one another. The support elements (7,8) can be rotated into a tilted position in which the support elements (7,8) are rotated relative to one another by a tilting angle (a). A locking element (9) is provided, which secures the support elements (7,8) against rotating in the working position, the locking element (9) bridging a connecting region (10) between the two support elements (7,8) in the working position. The locking element (9) can be brought into a release position in which the locking element (9) is arranged outside the connecting region (10).
