Abstract (en)
This invention relates to a slat (1) for roller shutters, comprising: - an internally hollow elongated body (10) extending in a longitudinal direction (X) and defining a coupling cavity (20) along a first longitudinal edge (11) thereof; and - a coupling appendage (30) extending from a second longitudinal edge (12), opposite the first edge (11), of said elongated body (10). The coupling appendage (30) consists of one or more profiled elements (31; 32, 33, 34), separate with respect to said elongated body, each of which is engaged on said elongated body (10) at a longitudinal engagement seat (13) which is made on said elongated body (10) along said second longitudinal edge (12). Each profiled element (31, 32, 33 and 34) protrudes from the elongated body (10) with a coupling portion 30a which protrudes from said longitudinal engagement seat (13). The slat (1) comprises one or more ventilation and lighting apertures that are defined by longitudinal slits (41) made on the coupling portions (30a) of said one or more profiled elements (31; 32, 33, 34) and/or by longitudinal spacings (42) between the coupling portions (30a) of two or more of said profiled elements (32, 33, 34). [Fig.6]
