Abstract (en)
[origin: WO2021094317A1] The invention relates to a dialysis machine comprising a fluid system, which has a supply line for providing fresh dialysis solution to a dialyser and a discharge line for removing used dialysis solution from the dialyser, wherein the fluid system has a balancing system arranged between the supply and discharge lines in order to balance the fluid volumes flowing through the lines, wherein the fluid system has an ultrafiltration line branching off the discharge line between the dialyser and the balancing system and having an ultrafiltration pump in order to be able to withdraw a defined volume of used dialysis solution from the balance process, and wherein an additional balancing chamber is provided, which is arranged in a section of the supply line located between the balancing system and the dialyser or a section of the discharge line located between the dialyser and the branch of the ultrafiltration line.
