Abstract (en)  
[origin: WO2021094188A1] The invention relates to a device for transporting packaging means, in particular containers, bottles and cans, comprising a transport means for transport of the packaging means which forms a transport plane, lateral guide elements for guiding the packaging means on the transport means, which lateral guide elements are movable transverse to the transport direction of the packaging means, and an adjustment device which is arranged under the transport plane, is perpendicular to the transport plane and which comprises transverse guide elements connected to the lateral guide elements, a thrust rod which is movably mounted in a transport direction and a drive device for moving the thrust rod. In order to provide a device for transporting packaging means which enables an easily reproducible and wide adjustability of the lateral guide elements and which is additionally particularly easy to clean, according to the invention each transverse guide element is connected to the thrust rod via a coupling arm, which is movably mounted on the thrust rod, movably mounted on the transverse guide element and oriented at an angle to the thrust rod, such that when the thrust rod moves, the distance of the lateral guide elements relative to each other changes.
