Abstract (en)

[origin: WO2021094137A1] The invention relates to a mounting frame for displacing and fixing in a shaft. The mounting frame (24) has a main frame (30), a first primary fixing component (46a) for supporting the mounting frame (24) against a first shaft wall, and a secondary fixing component (56) for supporting the mounting frame (46) against a second shaft wall of the shaft, the second shaft wall being situated opposite the first shaft wall in a fixing direction (40), when the mounting frame (24) is fixed in the shaft. The first primary fixing component (46a) and the secondary fixing component (56) are disposed on the main frame (30). The first primary fixing component (46a) and/or the main frame (30) can adopt a transport position and a working position, and a change in position by the first primary fixing component (46a) and/or the main frame (30) from their working position into their transport position leads to a reduction in the extension of the mounting frame (24) in an extension direction (27) that is different to the fixing direction (40).
