Abstract (en)

[origin: WO2021094272A1] The invention relates to a method, system and computer program for optimizing a production process (2) in a production system (3) from the metal production industry, the non-ferrous industry or the steel industry for producing semi-finished products or finished products, comprising the steps of: detecting state variables of the production system (3), detecting product defects of the products produced in the production system (3) and determining correlations between the detected product defects and the detected state variables of the production system (3), monitoring the state variables of the production system (3) in the future production of products and comparing them with the state variables of the determined correlations between the detected product defects and the detected state variables of the production system (3), and modifying the detection of product defects of the products produced in the production system (3) in the future if the comparison of the monitored state variables of the production system (3) in the future production of products with the state variables of the determined correlations between the detected product defects and the detected state variables of the production system (3) provides a sufficient match.
