Abstract (en)

[origin: WO2021099588A1] The invention relates to a method for determining the content of at least one plant constituent (1) in at least one part of a plant (3). According to the invention, so that the content of plant constituents, in particular secondary plant constituents, in at least one part of a plant can be determined and optimised more expediently, the at least one part of the plant (3) is irradiated successively with light (7) of different wavelengths and/or wavelength ranges, and, as a response to the irradiation of the at least one part of the plant (3) with light (7) of each wavelength and/or each wavelength range, the chlorophyll fluorescence (9) of at least substantially the same wavelength and/or at least substantially the same wavelength range is measured.
