Abstract (en)
[origin: WO2021099327A1] The invention relates to a stimulation device comprising a main part and a rubber-elastic sleeve which is intended for contact with a body part of a user and which encloses the main part and has a reversibly deformable contact surface region, wherein a shaping element, which is designed to produce a locally limited deformation of the sleeve without deformation of the main part, is arranged on the main part so as to be movable relative to the main part, and an actuating device, which is operatively connected to the shaping element in order to generate a movement of the shaping element, is arranged on the main part and comprises an electric motor having a rotor shaft to which an eccentric is fastened, and the shaping element comprises a pivotally mounted lever having two free ends, wherein a first end of the lever is operatively connected to the eccentric of the actuating device in order to convert a rotation of the rotor shaft into a pivoting movement of the lever, and a second end of the lever acts in a deforming manner on the contact surface region.
