Abstract (en)

[origin: WO2021148274A1] The invention relates to a method (100) and a system (1) for processing data on the occupancy of a means of transportation, in particular the occupancy of a train. The occupancy of a means of transportation with transport goods on a route being traversed by the means of transportation is detected (S1a), and corresponding occupancy information (A) is generated. Additionally, transport conditions of the transport goods are detected (S1b), and corresponding transport information (T) is generated. According to the invention, the occupancy information (A) and the transport information (T) are linked together (S2) in a data set (D), and the data set (D) is stored on a database (5). On the basis of multiple data sets (D) stored on the database (5) in this manner, an occupancy statistic (S) of the means of transportation and/or of the route being traversed by the means of transportation is ascertained (S3a).
