Abstract (en)  
[origin: WO2021105216A1] A cross brace (4) comprises an elongate bar portion (41) and two clips (42). The bar portion (41) has two substantially opposite longitudinal ends. The two clips (42) are each arranged at one of the two longitudinal ends of the bar portion (41) and are designed to engage almost fully around a bar-shaped element (25, 52). Moreover, the two clips (42) can each be brought to an opened position, in which the bar-shaped element (22, 52) can be received by the clip (42) and removed from the clip (42), and to a closed position, in which the bar-shaped element (22, 52) can be engaged fully around by the clip (42). The clips (42) have a lock (425), which locks the clip (42) in the closed position.
