Abstract (en)
[origin: WO2021105428A1] The invention relates to a motorized drive device (10), comprising an electric motor, a first holding device (37) and a first switching mechanism (41). In a first position of the first mechanism (41), a first guide wheel (38a) of the first holding device (41) is offset with respect to a second guide wheel (38b) of the first holding device (41), so as to maintain the motorized drive device (10) with respect to a rail by supporting the first and second guide wheels (38a, 38b) respectively with first and second raceways of the rail. Furthermore, in a second position of the first mechanism (41), the first guide wheel (38a) is positioned opposite the second guide wheel (38b) in a direction of movement of the motorized drive device (10) along the rail, so as to insert or extract the first and second guide wheels (38a, 38b) into or from the rail through a slot of the rail.
