Abstract (en)  
[origin: WO2021105572A2] The invention relates to a method and a device for determining the waiting time for one or more vehicle processors. Effectively, the duration (201) of the time elapsed between the locking and the unlocking of a vehicle. This determination is used for a set of lockings/unlockings for one or a plurality of vehicles. The locking and the unlocking of the vehicle are advantageously detected from the switching-on (24, 25) of the flashing lights of the vehicle. A set of durations is thus obtained, each duration being obtained for a pair of locking/unlocking events for one or a plurality of vehicles. The durations of the set obtained are analysed in order to determine the optimum waiting time to be applied to the vehicle(s).
