Abstract (en)  
[origin: WO2021105596A1] The invention relates to a method for managing an uninterrupted connection of a moving device (DR1, DR2) to at least one attachment entity (MNO1, MNO2, MNO2', MNO3, MNO3') of at least one operator of a communication network, the method being implemented by a mediation entity capable of communicating with the at least one entity (MNO1, MNO2, MNO2', MNO3, MNO3'), comprising receiving a connection request comprising an identifier of said device and information relating to the movement of said device, determining at least one offer of connection to the at least one attachment entity (MNO1, MNO2, MNO2', MNO3, MNO3') on the basis of a communication feature, with the transmission of a proposal comprising the at least one determined connection offer. Determining, by a mediation entity, the connection of the device before its movement enables, in particular, the movement of the device to be correlated with its connection and enables information relating to the operators or else to the mediation entity not to be disclosed.
