Abstract (en)

[origin: CN115196576A] The present invention relates to a beverage dispensing machine (1) comprising a receiving chamber (3) for receiving a beverage tub (4), a lid (10) movable between an open position and a closed position, a latch (21) movable between a retaining position in which the latch cooperates with a recess (26) to retain the lid in the closed position, and a release position in which the latch does not cooperate with the recess (26) to retain the lid in the closed position. The latch extends out of the recess to allow the cover to move to the open position, a reset member (23) for resetting the latch to the holding position, a handle (15), and a separating member (34). The handle and the separation member are movable between an activated position, in which the separation member moves the cover away from the receiving chamber to resist the reset member to move the latch to the release position, and a rest position, in which the separation member does not act on the cover or the receiving chamber.
