Abstract (en)
[origin: EP4068620A1] A frame for a vertical solar system is provided, the frame comprises a first post and a second post, each of said posts having a first and a second, mutually opposed, side, wherein the second side of the first post faces the first side of the second post, and comprising a first and a second aperture from the first to the second side through the post, wherein in vertical direction the first aperture is situated lower than the second aperture; the frame comprises a first pair of beams, the first beam of the first pair of beams extends through the first aperture of the first post, thereby providing a first projection at the second side of the first post, and the second beam of the first pair of beams extends through the first aperture of the second post. The frame comprises a second pair of beams, the first beam of the second pair of beams extends through the second aperture of the first post, thereby providing a second projection at the second side of the first post, and the second beam of the second pair of beams extends through the second aperture of the second post. At the second side of the first post the second beam of the first pair of beams is supported by the first projection, and the second beam of the second pair of beams is supported by the second projection.
