Abstract (en)

[origin: CA3159646A1] The invention relates to a method for operating a labelling system which comprises a labelling device having a feed assembly, a dispensing assembly and an application assembly; wherein at least one of these functional units comprises a sensor assembly; wherein, in a labelling routine, a control assembly activates the functional units in order to carry out the labelling process; wherein, in a monitoring routine, a monitoring assembly captures the sensor data detected by the sensor assemblies, which data correspond to a sensor capture density specified for the corresponding functional unit; wherein the labelling system comprises a user interface. According to the invention, in a user-query routine, a user is prompted by the user interface to input a state relating to a functional aspect of the labelling system, and the input state is transmitted to the monitoring assembly, which compares the input state with a specified state and, in the event of deviation, executes an internal response routine in which a sensor capture density, which is changed with respect to the previous sensor capture density, of at least one functional unit is specified; and, following the user query routine, the labelling routine and the monitoring routine are executed using the changed sensor capture density specified from the user query routine.
