Abstract (en)

[origin: WO202111206A1] A covering with a metal structure for roofs of buildings, comprising a plurality of slabs (10) having a substantially quadrilateral shape each of which is provided with profiled edges (17, 18) parallel and opposite to one another for reciprocal connection of the slabs (10) that are adjacent in a longitudinal direction and for formation of a joint (11) located between each of the adjacent slabs (10), wherein said profiled edges (17, 18) comprise bends (18, 19, 20, 21, 22, 23), at least partly symmetrical on the two edges and further bends (25, 26) realised on at least one of the profiled edges (17), wherein said profiled edges (17, 18) comprise at least one curvature at the bends (21) located lower than the longitudinal axis (11) and higher than the central axis of the slab, said covering further comprising a bracket (12) adapted to conjoin the profiled edges (17, 18).
