Abstract (en)
[origin: WO2021151494A1] The present disclosure relates to monitoring and anomaly detection in a computer network system. A device for monitoring the computer network system is configured to receive a dataset comprising a set of indicators indicative of a performance of the system, detect an anomaly in the performance based on the indicators, and determine a score for each indicator based on the detected anomaly, the score being indicative of a relationship of the respective indicator with the anomaly. Moreover, the device is configured to obtain an expert factor for each indicator in a subset of indicators, wherein each expert factor is indicative of a level of relevance of the respective indicator for a previous anomaly, and modify the determined score of each indicator in the subset based on the expert factor.
