Abstract (en)
[origin: WO2021119479A1] Methods, systems, and devices are described for mapping and treating tissue during a medical procedure. In some cases, a device includes a mesh of wires with sensors coupled thereto. The mapping device can be coupled to an expandable treatment element. Alternatively, the treatment device can be a separate device, and advanced through an access lumen in the mapping device. The expandable treatment element can include multiple segments. The sensors can be used to map a tissue area and monitor the tissue during a medical procedure
