Abstract (en)

[origin: WO2021116992A1] A roof device for a canopy. The roof device comprises a panel device and a screen device, wherein the screen device is located below the panel device. The panel device comprises a plurality of stackable panels (512) that are movable between an open position and a closed position, with the panels forming a substantially waterproof roof in their closed position. The screen device comprises at least one screen (532) which is movable between an open position and a closed position, wherein the screen in its open position is substantially invisible and wherein the screen in its closed position substantially completely covers the panels. A water drain is present underneath the panels and above the screen. Such a roof device increases the possible configurations in terms of light transmittance and/or waterproofness and combines in particular the advantages of a panel device with a screen device.
