Abstract (en)  
[origin: WO2021116098A1] Disclosed is a method for controlling an electromechanical actuator comprising a step (100) of determining a correction to be applied to the control signal of the electric motor, comprising at least the following substeps: - actuation of a rotation speed regulation of the electric motor, so as to keep the rotational speed of the electric motor under a predefined first setpoint value, and; - actuation of a regulating of the current consumed by the electric motor at a second predefined setpoint value and/or application of a delay between the control current of the electric motor and an electromotive force of the electric motor, the delay being chosen to be equal to a third predefined setpoint value.
