Abstract (en)
[origin: WO2021116349A1] The invention relates to a device comprising: - a shielding part (10) made of a material having a plastic deformation domain under load before breaking and an elastic deformation domain, the plastic deformation domain representing less than 1% of the elastic deformation domain, and - a deformation sensor (2) attached to the shielding part and configured to plastically deform under the effect of at least one stress applied to the shielding part and leading to a damage of the shielding part.
