Abstract (en)

Provided is a mechanism with which technologies related to suction devices can be further improved. This suction device comprises: a heating unit that heats an aerosol source disposed in a space to be heated; an intermediate member that forms an air flow path and has a first hole that causes the air flow path to communicate with the space to be heated, and a second hole that causes the air flow path to communicate with a space not to be heated by the heating unit; and a temperature changing unit that is provided to the intermediate member and raises the temperature with aerosol generated by the aerosol source heated by the heating unit and included in air flowing from the first hole into the air flow path.
