Abstract (en)

[origin: WO2021122688A1] The invention relates to a closure arrangement (1) for a vessel (2) containing a pharmaceutical substance, having a stopper (3), having a metal cap (4), for securing the stopper (3) on the vessel (2), and having an overcap (5) made of plastic, wherein, for the purpose of identifying contents of the vessel (2), a wirelessly readable, electrical memory unit (6) is connected to the closure arrangement (1). In order for a closure arrangement of the type in question to be improved further, in particular in respect of tamper-evident sealing, it is proposed that the memory unit (6) should be operatively connected both to the overcap (5) and to the stopper (3), said operative connection having a lasting effect on the memory unit (6) when the overcap (5) is torn off.
