Abstract (en)

[origin: WO2021123674A1] The invention relates to a defibrizing device (1) for defibrizing a fibrous composition (2), comprising a device (3) for collecting the fibrous composition (2) and at least one brush-type rotary element (34, 35) that has at least one row of bristles (4) and is able to decompact and aerate said fibrous composition (2) so as to obtain non-agglomerated individual fibers (21), said rotary element (34, 35) having a rotational shaft (340, 350) mounted perpendicular to the lateral walls (30) of the collecting device (3), and a distribution device (5) for ejecting the individual fibers (21) which communicates with the collecting device (3). The invention further relates to the use of said defibrizing device for decompacting and aerating a fibrous composition (2) so as to obtain non-agglomerated individual fibers (21).
