Abstract (en)

[origin: WO2021121989A1] The invention relates to a building system (1) comprising a camera system (4) and an image processing device (22) which generates a real-time facial template for facial features of the user (2, 2a) from a camera recording of a user (2, 2a) when the user (2, 2a) stops in a building zone (12). A control and processing device (8) searches a storage device (26, 28) for a reference facial template which matches the real-time facial template to a specified degree, wherein in the event of a match, the user (2, 2a) is a registered user (2). A bidirectional communication channel (18) is ascertained from the user profile of the user (2, 2a) for a private communication between the building system (1) and a wireless device (6) of the user (2, 2a).
