Abstract (en)
[origin: WO2021197682A1] The invention relates to an energy distribution system (1), preferably an energy distribution system that is dynamically adjustable by means of the connected energy store, the system comprising: a large number n of interfaces (Sn) which are designed to be able to couple thereto a corresponding number i, where $i \leq n$, of electric vehicles (Fi) for a particular period of time for energy exchange, wherein, for this purpose, the coupled and electrically connected electric vehicles (Fi) are temporarily integrated, in the form of either a current provider (A) or a current collector (E), in the energy distribution system (1) via a vehicle-side and/or system-side controller (Si) and/or user interface (Bi), and, via a controller (2), allow, via a wired or wireless transmission topology, an energy exchange with one or more of the other electric vehicles (Fi) connected to an interface (Sn).
