Abstract (en)
[origin: WO2021137262A1] The invention relates to a bearing system for a door, comprising: a frame, which acts as a blind frame for the leaf (1) of the door and is provided with at least two different cavities (3) which are produced in a jamb (2) of the frame; and at least two hinges of a plurality of hinges (4, 5, 6), which connect the leaf (1) and the jamb (2) to each other and define a pivot axis (A), wherein each hinge (4, 5, 6) comprises a pivotable component (7) which is connected to the leaf (1) and can pivot about a separate pivot axis. Each hinge (4, 5, 6) is arranged in a single cavity (3) and also comprises a pair of connecting bodies (8, 8; 8, 9; 8, 18), of which each is connected to the jamb (2) and by means of which the hinge (4; 5; 6) is connected to the frame. The pivotable component (7) is mounted such that it is pivotable relative to the connecting body pair (8, 8; 8, 9; 8, 18). The pivotable component (7) additionally has a cover portion (7a), the shape and dimensions of which are such that when the door is closed, said cover portion (7a) largely covers the opening of the cavity (3) in which the hinge (4, 5, 6) is arranged and the outer surface thereof and the outer surfaces of the jamb (2) and the leaf (1) are coplanar. The pivot axis (A) of the leaf (1) and the pivot axis of the pivotable component (7) coincide.
