Abstract (en)

[origin: WO2021140378A1] An apparatus includes at least one housing configured to be implanted on or within a recipient's body. The apparatus further includes first circuitry configured to wirelessly receive power from a device external to the recipient's body, second circuitry configured to provide stimulation signals to a portion of the recipient's body, and at least one power storage device having a discharged state in which the at least one power storage device is discharged to a voltage below a minimum operating voltage of the at least one power storage device. The apparatus further includes third circuitry configured to, while the at least one power storage device is in the discharged state, controllably distribute the power simultaneously to both the second circuitry and the at least one power storage device.
