Abstract (en)

[origin: EP4089894A1] An object is to provide a technique for improving the durability of a circuit board attached to a rotating body and a device that includes same. A circuit board 50 according to the embodiment is fixed to a rotating body, and oriented such that its plate thickness direction is parallel to the rotation axis of the rotating body. The circuit board 50 includes either a plurality of devices mounted thereon such as to be distributed around the rotation axis so that the circuit board 50 as a whole has a center of gravity located in a central area of rotation, or a single device mounted thereon in an annular shape such as to have a center coinciding with the rotation axis.
