Abstract (en)
There is provided a bearing assembly (24). The assembly comprises a housing (32), a spherical bearing (26) located within the housing (32), and two outer races (34, 36) positioned between the spherical bearing (26) and the housing (32). The outer races (34, 36) are configured in sliding engagement with the spherical bearing (26) to allow the spherical bearing to rotate relative to the housing (32). The assembly comprises a tightening element (44) configured to engage a first of the two outer races and tighten the outer races against the spherical bearing, wherein the assembly is configured to provide a primary load path (98) from the tightening element (44) to the housing (32), wherein the primary load path (98) leads from the tightening element (44) to the housing (32) via the outer races (34, 36) whilst bypassing the spherical bearing (26).
