Abstract (en)
[origin: WO2021151001A1] The present disclosure provides chimeric polypeptide comprising a cage polypeptide comprising a degron, wherein the degron is sequestered or caged to the C-terminus of the latch region. Upon activation by a key polypeptide, the degron becomes active. The degron can be ubiquitinated and be marked for degradation, together with any biologically active molecule attached to the chimeric polypeptide. The chimeric polymeric of the present disclosure can be incorporated, for example, to chimeric antigen receptors (CAR). Accordingly, in response to the administration of a key polypeptide or endogenous expression of a key polypeptide mediated, for example, by an inducible promoter, the amount of CAR expressed on the surface of an immune cell can be modulated.
