Abstract (en)

[origin: WO2021148660A1] The computerized system for analyzing the calendar zoning of a user, comprises: - a remote central server (7) that receives the location data from a wearable system (4), - a mapping of a farm, which comprises a plurality of predefined geographical zones (1, 2, 3). The computerized system comprises a processing module (18) that determines a length of time that the wearable system (4) spent in a predefined geographical zone (1, 2, 3) using the location data. A particular geographical zone (3) is predefined independently of the topology of the ground, and the processing module (18) determines the length of time according to the particular geographical zone (3) and/or a series of locations detected in different predefined geographical zones (1, 2, 3).
