Abstract (en)

[origin: WO2022248143A1] The invention relates to a knitting device (14) comprising a sinker (1) and to a method, the device and method making it possible to produce a knitted fabric with an even mesh structure over the entire service life, and having a pair of operative elements which comprises at least two sub-elements (6, 18). By means of the pair of operative elements, a force (7) can be exerted on the sinker (1) so as to act downward in the sinker height direction (H). During knitting, this force (7) can act counter to loop formation forces that act on loop formation means (3) of the sinker (1), and in this way prevent unevenness - for example slurgalling - in the knitted fabric produced.
