Abstract (en)
[origin: WO2021151727A1] The invention relates to a detergent container for a cleaning appliance (100) having a receiving shaft and a contacting device (106) for the detergent container (200). The detergent container has a housing for storing a detergent, the housing being shaped so as to be inserted in a receiving shaft of the cleaning appliance (100). The detergent container further has an electrically conductive contact region which is arranged on an outer side of the housing and constitutes a content coding that represents a detergent container content. When the housing is inserted, the contact region can be contacted using the contacting device (106) so that the content coding can be detected.
