Abstract (en)
[origin: WO2022254156A1] The invention relates to an accessory which comprises a suction tube (7); a grip handle (11) hingedly mounted with respect to the suction tube (7); and a locking mechanism (13) having a latch (14) which is movable between a locked position in which the latch (14) locks the grip handle (11) with respect to the suction tube, and a released position in which the latch (14) allows the grip handle (11) to pivot with respect to the suction tube. The locking mechanism (13) has an unlocking member which is movable between first and second positions, the locking mechanism (13) being configured such that a movement of the unlocking member from the first position to the second position causes the latch (14) to move from the locked position to the released position. The latch (14) has two lateral locking members (16) arranged on either side of the unlocking member.
