Abstract (en)

[origin: WO2021160896A1] The invention relates to a computer mouse (300) for carrying out inputs into a computer unit that can be coupled to the mouse, comprising a mouse body (301) that can be at least partially gripped and a mouse wheel (303) that is rotatably supported on a carrying structure (302) of the mouse body (301), the mouse wheel (303) being able to be rotated by a finger to carry out an input. The mouse wheel (303) comprises at least two actuation zones (304). A movement of the mouse wheel (303) can be damped by means of a controllable brake device (1) in a targeted manner dependent on the actuation zone (304) from which the mouse wheel (303) is actuated and/or dependent on which actuation zone (304) was previous activated.
