Abstract (en)
[origin: WO2021164970A1] The invention relates to a grinder (GAR) having a grinding table (GTL) which is rotatable about a first rotation axis (RX1) and comprises at least two grinding rollers (GRL), each of which is rotatably arranged about a respective second rotation axis (RX2) such that ground material can be comminuted between the grinding table (GTL) and the grinding rollers (GRL) during operation. The invention also relates to a method for operating the grinder (GAR). In order to increase availability, according to the invention the grinder (GAR) comprises at least one sensor arrangement (SNA) by means of which an inclination change of the grinding table (GTL) beyond a certain threshold value (TRS) can be detected.
