Abstract (en)

[origin: WO2021167910A1] A method for generating an image depth estimation neural network that estimates at least one depth measure of an image of a scene, the method comprising: receiving a first set of images, the first set of images being a plurality of images of a scene taken by one or more cameras; receiving, for each image in the first set of images, an associated focal length that is an estimate of a focal length of the camera that took the image; transforming the first set of images into a set of normalized training images, the set of normalized training images representing how images of the first set of images would appear if the images of the set had a joint focal length, wherein transforming an image of the first set of images into a normalized training image comprises rescaling the image, the rescaling representing a change in the associated focal length of the image such that it approaches the joint focal length; training the neural network to predict at least one depth measure of an image, wherein training the neural network comprises providing the neural network with a training dataset of pairs of input data and output data, wherein the input data of the training dataset comprises the set of normalized training images.
